                                                                                                                                                                                                                                                                                                                                                                        This peptide comprises the strep-tag peptide that is recognised by streptavidin. A form of novel growth factor (HIL (see AAW32479) was generated by PCR that contains a FLAG epitope (see AAW32484) at its N-terminus and the strep-tag at its C-terminus. The construct is designated LHL.seq (see AAW32481), where L is the immunoglobulin binding entity from peptostreptococcus magnus and H is residues 42-62 of hen egg lysozyme. The strep-tag was used for purification of LHL.seq over a streptavidin column. Thus, the LHL-seq was not purified on the basis of binding lamunoglobulin, thereby eliminating potential contamination by other bacterial proteins which also bind immunoglobulins. LHL.seq has identical activity to that of LHL, and can be used in novel methods for the generation of catalytic antibodies
                                                                                                                                                                                                                                                                                                                           Sequence 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 3; Page 40; 109pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New catalytic antibody precursors -
binding portion which can induce B-c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAW59211 and AAW59212 are ligands used in a method to assay binding affinity of streptavidin mutants. These method have a mutation within the amino acid (aa) region 44-53 of the wild-type protein show a higher binding affinity than the wild-type for peptide ligands that include the sequence of formula Trp-X-His-Pro-Gln-Phe-Y-Z where X = any aa; Y and Z are both Gly, or Y = Glu and Z = Axg or Lys. Recombinant streptavidin mutants can be used to isolate, purify and determine proteins or to determine/recover substances that contain streptavidin-binding groups. Such compounds may also be used to immobilise fusions on microtitre plates, microbeads or sensor chips
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 9 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Streptavidin mutants with higher binding affinity for peptide ligands have mutation in amino acid region 44-53, used to isolate, purify or determine fusion proteins including these ligands.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Streptavidin; ligand recover; immobilise.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents an artificial Strep peptide epitope. It is used CC in a recombinant nucleic acid construct encoding an epitope-tagged prion protein (Prp). The construct comprises a first nucleic acid sequence CC encoding an amino acid sequence of a biologically active protein fragment and a second nucleic acid sequence encoding a heterologous epitope CC domain. The heterologous epitope domain is a peptide selected from a peptide group of FLAG, Strep, poly-histidine, human c-myc peptide CC recognised by monoclonal antibody 9E10 and haemagglutinin peptide CC recognised by monoclonal antibody 9E10 and haemagglutinin peptide CC recognised by monoclonal antibody 12CAS. The protein has two different three concirmation conformations and the epitope domain is spatially positioned CC dimensional conformations and the epitope domain is more exposed in a CC first confirmation relative to a second conformation. The nucleic acid CC construct may be used for the production of transgenic animals or cells CC that are useful in a method for distinguishing between different CC conformational shapes of a protein. These methods are particularly useful cin studying diseases caused by prion proteins, e.g. Creutzfeldt-Jakob CC disease (CJD), scrapie and bovine spongiform encephalopathy (BSE)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of immunogloblin. When the antigen is cleaved the B cell surface part can interact with its target. The growth factor precursors are used to Select B cells that produce Ag-specific CAb, and to generate CAb from Such cells (by inducing mitogenesis, caused by the growth factor released by specific cleavage). The Ag-specific CAb can be directed against, e.g. tumour necrosis factor (treatment of rheumatoid arthritis or toxic shock Syndrome); viral docking receptors (treatment of human immune virus, CC hepatitis and influenza infections); tumour-specific antigens; amyloid plaque (treatment of Alzheimer's disease or myeloma) or IGE (treatment of allergies such as sathma). CAb may also be used for drug detoxification, CC allergies such as sathma). CAb may also be used for drug detoxification, CC treat autoimmune or inflammatory diseases and to eliminate environmental or industrial pollutants, such as plastics and petroleum. Particularly the growth factor precursors are produced by delivering the corresponding nucleic acid in a viral or other gene therapy vector. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents an epitope, which may be attached to CC chimeric polypeptides of the invention. The specification describes CC chimeric polypeptides which comprise at least one SCHAG (self-coalesces into higher-order aggregates) amino acid sequence fused in frame with a CC polypeptide of interest (which is other than a marker protein, a CC specification also describes chimeric polypeptides that comprises an CC entrologenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple reactivities, CC e.g. derivatised with enzymes, or specific binding partners, and useful CC engene therapy, protein production, imparting disease resistance to plants, or altering plant pigmentation and for diagnosis and treatment of prion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

         This invention relates to recombinant vectors, comprising a promoter sequence and a nucleotide sequence encoding a first protein, which is a membrane protein, or multisubunit protein. The recombinant vector is to the crystallisation of proteins that are otherwise difficult to crystallise. This sequence represents the Strep-tag nonapeptide. This linker acts as a bridge between subunit IV and the foreign fusion protein of plasmid pMB908 (see AAH99982)
                                                                                                                                       Claim 19;
                                                                                                                                                     New recombinant vectors comprising promoter and nucleotide suseful in methods of crystallization, particularly for the crystallization of proteins that are otherwise difficult to
                                                                                                                                                                                                                                          Iwata S,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      reaction system are labeled with one of a pair of substances adhering to each other and the other substance of the pair is used as an adsorbent for capturing labeled protein components after translation. The produced protein is efficiently isolated at a high purity from the reaction system, and at the same time, the problem of consumption of energy in the reaction system is resolved. This sequence represents a strep-tag which binds to streptayidin and can be used to purify peptides in the peptide

                                                                                                                                                                                                                                                                                                                                                              The invention comprises a method for treating a neurological disease or a central nervous system (CNS) disorder. The method involves displaying a therapeutic molecule capable of treating the neurological disease or CNS disorder on a viral display vehicle. The viral display vehicle is then introduced into the olfactory system of a subject to treat the disease or disorder. The method of the invention is useful for preventing, treating and diagnosing neurological diseases or CNS disorders, such as:

Alzheimer's disease; Creutzfeld-Jakob disease; Huntington's chorea; viral

Also described: (1) a vector CC comprising the recombinant nucleic acid; (2) a host cell comprising the CC recombinant nucleic acid or the vector; and (3) a method for producing CC the host cell with the recombinant nucleic acid or with the vector, where CC the host cell is capable of expressing the protein cited above. (1) has CC hepatotropic, virucide and antiinflammatory activities, and can be used in gene therapy and vaccines. The recombinant nucleic acid is useful for CC cells, such as yeast cells. The HCV envelope proteins in eukaryotic cells, such as yeast cells. The HCV envelope proteins may be used as a CC vaccine, or for incorporation into an immunoassay for the detection of CC anti-HCV antibodies, and/or genotyping of HCV, for prognosing or used is used for producing HCV envelope protein or has cell.                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method for isolating mRNA from a population of cells. The method involves selectively isolating ribosomes or proteins that bind mRNA in a cell type specific manner and then isolating the mRNA bound to the ribosomes or proteins that bind mRNA. The method is useful for facilitating the analysis and quantification of gene expression in a selected cell type present within a heterogeneous cell mixture. The method may also be used in diagnostics or therapies for human diseases. The present sequence is Strep-tag peptide. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            08-MAY-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to Hepatitis C virus (HCV) envelope protein with glycosylation site(s). The HCV envelope protein, or the pharmaceutical composition comprising the envelope protein, is useful as a medicament a vaccine, particularly for inducing a HCV-specific immune response, inducing HCV-specific antibodies or inducing a T-cell function in a mammal. The protein is particularly useful for preventing, treating or diagnosing HCV infection. It is also useful for detecting the presence diagnosing HCV infection. It is also useful for detecting the presence anti-HCV antibodies in a sample. The present sequence is a peptide used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Depla E,

The invention describes a method of determining the effects of a CC candidate agent on activation of a G protein coupled receptor (GPCR). The CC method comprises contacting a candidate agent with a modified G protein CC alpha subunit and a GPCR, and detecting a level of G protein activation is contacting a ferrivation is contacting a ferrivation is contactive of the effects of the agent on the activity of GPCR. The CC method is useful for determining the effects of a candidate agent on CC activation of a G protein coupled receptor, evaluating new agonists, cc and/or inverse agonists for GPCRs, identifying ligands for GPCRs, and CC developing a strategy for identifying GPCRs involved in different CC biological processes, including diseases. The invention provides rapid cand more sensitive bioassays for evaluating new agonists and/or inverse agonist for GPCRs. The method can be performed using membranes, cc which increases both the ease of performing the assay and its efficacy, and also allows high throughput acreening of GPCR activity. Furthermore, this method directly measures GPCR activity, and thus is less labour-cc intensive than the conventional methods. This sequence represents the Strep tag, an example of an epitope tag that can be used to tether the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            agents that modulate activity of a membrane-spanning, signal-transducing (MSST) protein. The method involves detecting a conformational change in a MSST protein upon interaction with a ligand. The method is useful for identifying agents that modulate (e.g. agonists or antagonists) activity of MSST protein. The present sequence is a strep epitope tag used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                Determining effects of candidate agent on activation of a G protein coupled receptor (GPCR) for evaluating new agonists and/or inverse agonists for GPCRs by contacting a candidate agent with a modified (protein alpha subunit and a GPCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      US6448377-B1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ର ର ର
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Strep tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 9

                                  reaction solution containing all necessary components of the transcription/translation system, amino acids, nucleotides and metabolites that supply energy and that are needed for synthesis. The proteins formed are immobilised on a matrix. The method allows simple recovery of proteins without a separate isolation step and the amount of proteins produced can be determined before a reaction is complete. Continuous removal of proteins prevents it interfering with the expression process, making possible synthesis of proteins that interact adversely with the process, so normally produced and is applicable to proteins of any size. This sequence represents a highly conserved peptide from E. coli streptavidin which is used to illustrate the method
                                                                                                                                                                                                                                                                 comprises a matrix.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 9 AA;

GENERAL INFORMATION:

APPLICANT: Kobilka, Brian K.

APPLICANT: Ghanouni, Pejman

APPLICANT: Lee, Tae Weon

TITLE OF INVENTION: Conformational assays to detect binding

TITLE OF INVENTION: to membrane spanning, signal-transducing I

FILE REFERENCE: STAN-213CIP

CURRENT APPLICATION NUMBER: US/10/692,071

CURRENT FILING DATE: 2003-10-22

PRIOR APPLICATION NUMBER: DT/US02/13250

PRIOR APPLICATION NUMBER: 09/935,061
                                                                                                                                                                                                                                                                                                                                                                                                                             S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score

Sequence 3, Application US/08660626

Patent No. 5789655

GENERAL INFORMATION:

APPLICANT: Stanley B. Prusiner

APPLICANT: Glenn C. Telling

APPLICANT: Fred E. Cohen

APPLICANT: Michael R. Scott

TITLE OF INVENTION: TRANSGENIC ANIMALS EXPRESSING

TITLE OF INVENTION: EPTOPE-TAGGED PROTEINS

NUMBER OF SEQUENCES: 13

CORRESPONDENCE ADDRESS:
몽
                                                                                                                                                      US-08-660-626-3
                                                                        Query Match
